

A MESH TO EQUIP YOUR PHONE

To avoid being affected by the harmful effects of the torsion fields produced by phones, we recommend using a mesh built on a specific arrangement of right and left clovers. After multiple trials, one mesh stood out for its effectivenessité :

Click on the image to obtain it in svg format (63x94 mm, 224x333 px). A sheet (A4) of nine cut-out meshes is also available [here](#). Simply insert one between the protective cover and the phone, with the design facing the device.

NB: It should be clear that while this mesh allows you to escape the power of the torsion fields emitted by confining them to an extremely small volume within the device, it would be illusory to think that you could carry a significant source of microwaves against your brain without eventually suffering some damage.
